REGENERATIVE MEDICINE

## Clinical Observation From Dr. Thomas Nabity in the Utilization of SuperShot® PRP for Multiple Indications

"I've been performing PRP and BMC procedures since 2015 and have been quantifying my procedures with cell counts since 2018. Since incorporating the SuperShot PRP process into my PRP and BMC preparation 10 months ago, I have noticed 3 significant differences in patient outcomes:

- Patients experience less inflammatory pain during the initial post-injection period.
- Patients experience a quicker reduction in their baseline pain, with reduced pain occurring at 3-4 weeks rather than 4-6 weeks post-injection.
- More profound pain reductions and a higher percentage of successful outcomes at 6 months.

I have used SuperShot PRP on multiple indications and have observed these outcomes consistently for all treatments.

We are currently tracking outcomes using the Data Biologics patient registry and hope to have data that supports my clinical observations in the near future."
